

Overall Project Roadmap

AUDIT → PAID BETA → MVP · A 12-WEEK ARC (+ GROWTH)

An execution-ready roadmap taking RangeClarity from a built-but-unsold indicator to a paying private beta — no redesign loops, no premature infrastructure. One question governs every phase:
can RangeClarity deliver enough real value to charge the first five customers?

The bet, in one page

THE SITUATION

RangeClarity already owns its hardest asset: a real, 465-line TradingView Pine indicator. What is missing is not more product — it is **proof of value** and a **way to take money**. The landing page builds but converts nothing (its CTA posts to a dead `action="#"`). There is no payment, no access path, and the indicator is not yet validated on real charts.

THE BET

Sell the indicator **Pine-first** to five paying beta users. The web app stays marketing + access only. Defer auth, billing engines and the website brain until paying users prove the loop. Prioritise the one journey that turns a visitor into a verified paid user who immediately understands what they bought.

THE 12-WEEK ARC

- **Wk 1** — Audit & lock direction
- **Wk 1-2** — Paid beta access loop
- **Wk 3-4** — Core product value MVP
- **Wk 5-6** — Indicator polish
- **Wk 7-9** — Website brain foundation
- **Wk 10-12** — Private beta launch
- Wk 13-16 — Growth system

SINGLE GOVERNING TEST

"Can RangeClarity deliver enough real value to charge the first five customers?"

Every phase is scored against this — not feature count.

The north star

RangeClarity turns a wall of charts into a short, ranked, explained list of the **structures worth watching** — a clean map on the chart, a clarity radar behind it.

THE FOUR PLAIN QUESTIONS IT ANSWERS

- **What is the structure?** — bias: bullish / bearish / sideways / unclear
- **Where are the levels that matter?** — Local / Key / Strong S/R + channel
- **How far is price from them?** — distance to the levels that count
- **Which charts are interesting now, and why?** — ranked across a watchlist

WHO IT IS FOR

- Self-directed swing traders & investors who think in **structure**, not signals
- Watchlist-driven users tracking 20-200 symbols who need a daily "what changed" radar
- Discretionary traders wanting a clean second opinion — not a black box

THE PHILOSOPHY

Simple visual · complex engine · clear context.

The indicator is the lens. The brain is the radar. Restraint is the brand.

What RangeClarity **is** — and is not

RANGECLARITY IS

- ✓ A market-**structure clarity system**: a clean chart overlay + a clarity radar
- ✓ A reader of **range, bias, support/resistance, channel state**, strength & score
- ✓ A way to see **which of your charts are at a decision point** today
- ✓ Educational decision-**support** — it describes structure; the user decides
- ✓ Deliberately narrow & premium — "**clarity over noise**"
- ✓ Sold as a **TradingView Pine indicator**, invite-only, for a paid beta

RANGECLARITY IS NOT

- ✗ A **buy / sell signal** service or an entries-and-exits bot
- ✗ A **prediction** or probability-of-direction engine
- ✗ A win-rate, target/stop, or guaranteed-profit product
- ✗ Financial advice — no advice framing anywhere
- ✗ A noisy RSI + MACD + VWAP + FVG + liquidity pile-up
- ✗ Crypto hype, generic SaaS, or trading-guru marketing

LANGUAGE GUARDRAIL — NON-NEGOTIABLE

No profit / win-rate / buy-sell / guarantee language on the chart, in the scanner, in the brief, or in marketing. This restraint is the moat, not a limitation.

One brain, two bodies

READING THE MAP

A single tested **canonical scoring core** defines the structure math. The Pine indicator and the web scanner

STATUS LEGEND

THE ANCHOR

Parity by **test vectors**, not a shared runtime. Divergence between chart and web is the #1 architectural risk — fixtures gate both.

The **six layers**, by responsibility & status

TRADINGVIEW VISUAL LAYER

The lens. Clean Pine overlay: S/R tiers, soft structure channel, bias, distances, dashboard, descriptive alerts. Visible truth for one chart.

BUILT ·
VALIDATING

WEBSITE BRAIN / CANONICAL CORE

The radar. The tested scoring spec + a server scanner that runs it across many symbols, ranks by clarity, and stores history the chart cannot.

CORE:
NEXT

SCANNER: PHASE
4

SYNC LAYER

TradingView alert webhooks → schema-shaped events into the brain, validated and de-duplicated. Bridges live chart events to history. Additive, never required.

POST-
BETA

MARKET ROOM

The primary web UI: ranked, explained cards of the charts worth watching today, with filters and a daily clarity brief over the user's watchlists.

POST-
BETA

HERMES / AI EXPLANATION

Turns schema rows into short, plain-language reasons a chart is interesting. Deterministic templates first, LLM phrasing later — always behind a no-advice guard.

POST-
BETA

GROWTH / COMMUNITY LAYER

X content engine, demos, short videos, educational clarity posts, and the beta-access funnel. The repeatable top of funnel into paid beta.

PHASE
6

The arc, phase by phase

Exact dates run Jun 20 → Oct 10, 2026. The **12-week core arc** (Phases 0-5) delivers a live private beta by Sep 12; Phase 6 (Growth) extends four weeks beyond.

Gantt-style schedule

CRITICAL PATH

Validate indicator → stand up offer/access → point CTA → core value screen. Everything else waits behind it.

PARALLELISABLE

Indicator polish (P3) and the canonical core spec (EN-1) can run alongside the access loop with a second contributor.

FLOAT / SLACK

Website brain (P4) holds the most slack — it can compress or slip without moving the private-beta date.

Mission & exit gate per phase

PHASE	WINDOW	MISSION	EXIT GATE – WHAT PROVES IT IS DONE
 P0	Jun 20-23	Project Audit & Lock Direction Inspect repo, document current state, stop the redesign loop, lock the product promise.	Signed-off current-state audit + one locked product promise; no open redesign debates.
 P1	Jun 24 - Jul 7	Paid Beta Access Loop Build the full journey: landing to register to sandbox payment to verified access to product entry.	A test user completes the loop end-to-end in sandbox and lands inside the beta area.
 P2	Jul 8-21	Core Product Value MVP Make value legible in seconds: clarity dashboard, watchlist sample, score & state, TV onboarding.	A new paid user understands what they bought and why it matters without a call.
 P3	Jul 22 - Aug 4	TradingView Indicator Polish Sharpen the visual layer: S/R tiers, strong zones, weak structure, range position, dashboard clarity.	Indicator passes the test matrix on 1D + 4H/1H; founder verdict "worth charging for".
 P4	Aug 5-25	Website Brain Foundation Canonical logic outside Pine: watchlist, stored assets, scoring model, explanations, history, snapshots.	Scanner reproduces indicator scores via shared fixtures (parity) over a sample universe.
 P5	Aug 26 - Sep 12	Private Beta Launch Onboard the first paying users, collect structured feedback, validate willingness to pay.	First 5 paying users onboarded; feedback logged; renew/refund signal captured.
 P6	Sep 13 - Oct 10	Growth System X content engine, demos, short videos, educational clarity posts, waitlist to beta conversion.	Repeatable weekly content + a measured top-of-funnel into the paid beta.

A phase does not start until the prior gate is signed off. Gates are evidence, not calendar dates — the schedule serves the gate, never the other way around.

What blocks what

TWO HARD GATES

RC-6 (indicator validated) and **O-002** (offer + price) gate the entire money path. Resolve both in week 1.

CONVERGENCE

Access loop, core value, and indicator polish all converge on **Private Beta (P5)** — the first revenue milestone.

DECOUPLED

EN-1 (canonical core) seeds the website brain but is off the revenue critical path — start early, finish calmly.

Likelihood × impact heatmap

TOP RISK

R1 — Indicator is not worth paying for. Mitigation: validate (RC-6) before any spend; founder go/no-go gate.

WATCH

R2 — Chart/web divergence. Shared golden fixtures enforce parity. **R3 — Redesign loop.** Direction is locked in P0.

POSTURE

Most risk is **de-risked by sequencing** — validate value and avoid building infra before demand is proven.

Activation (saw core value)	—	≥ 80%	P2/P5	reached core value screen + applied indicator
Willingness to pay / retain	unknown	≥ 3/5 renew intent	P5	structured beta feedback + renewal signal
Top-of-funnel (growth)	0	weekly cadence	P6	CTA → Whop clicks, content reach

Where focus lives

NOW · WK 1-2

- **Validate** the indicator (RC-6)
- **Decide** offer + price (O-002)
- Build the **paid beta access loop** (sandbox)
- Point the live **CTA at the real offer**

NEXT · WK 3-9

- **Core value screen** + onboarding
- Indicator **polish** to "worth charging"
- **Canonical core** spec + fixtures (EN-1)
- Website **brain foundation** (scanner)

LATER · WK 10+

- **Private beta** — onboard the first 5
- **Growth system** — content + demos
- Market Room, Hermes, sync layer
- Self-serve auth / billing (only if demand proves it)

The discipline: nothing moves from LATER to NOW until a paying user demands it. The roadmap protects focus as fiercely as it sequences work.

What **not** to build yet

DO NOT BUILD (PRE-VALIDATION)

- ✗ In-app **Stripe / auth / entitlements** stack for 5 users — Whop + invite covers it
- ✗ A **live-money** payment path — sandbox only until founder approval
- ✗ The full **Market Room** / multi-ticker scanner before the core loop is proven
- ✗ **LLM** Hermes explanations — templates first, behind a no-advice guard
- ✗ **Another landing redesign** — the page exists; point it at the offer
- ✗ A licensed market-data feed / charting engine — TradingView supplies it free

BUILD INSTEAD

- ✓ Proof the indicator is **worth paying for**
- ✓ The **one complete journey**: land → register → sandbox pay → access → value
- ✓ A **core value screen** a buyer grasps in < 5 minutes
- ✓ Honest **docs + disclaimers** (no-advice, beta limits, what to test)
- ✓ The **canonical core spec** + fixtures, quietly, in parallel

Why this matters: building auth, billing and a scanner for five customers is over-engineering that delays the only thing that de-risks the company — revenue. Restraint here is a strategy, not a shortcut.

Recommended roles & freelancers

ROLE	WHEN	LOAD	WHY / SCOPE
Founder (product + GTM)	All phases	Lead	Owns the offer, price, validation verdict, beta relationships, and every go/no-go gate.
Pine / quant developer	P0, P3, P4	0.4-0.6 FTE	Validate & polish the indicator; co-author the canonical scoring spec + golden fixtures.
Full-stack (Next.js/TS)	P1, P2, P4	0.5-0.8 FTE	Access loop, core value screen, Whop wiring, and later the scanner/brain endpoints.
Product designer (contract)	P1-P2	~1 wk	Trust-and-comprehension polish only — no redesign. Premium fintech feel, mobile pass.
Technical writer (contract)	P2	2-3 days	Indicator user guide, beta limitations, disclaimers, "what this means / does not mean".
Content / motion (contract)	P6	part-time	X content engine, short demos, educational clarity posts. Starts only at growth.

LEANEST VIABLE TEAM

Founder + one part-time full-stack who can also touch Pine. Everything else contracted by the day.

HIRE TRIGGER

Add the quant dev only after RC-6 confirms the indicator is worth investing in.

DO NOT HIRE YET

No DevOps, data-eng, or community manager until the beta validates demand.

Lean · standard · premium

LEAN

\$0-0.6k

PER MONTH · TO PRIVATE BETA

- Founder builds; AI-assisted dev
- Whop fees + domain + Vercel free tier
- Discord free; no paid tools
- **Tradeoff:** slower, founder-bound

STANDARD · RECOMMENDED

\$1.5-3k

PER MONTH · TO PRIVATE BETA

- Part-time full-stack contractor
- Day-rate design + writing polish
- Analytics + email + hosting paid tiers
- **Tradeoff:** balanced speed & spend

PREMIUM

\$5-9k

PER MONTH · TO PRIVATE BETA

- Dedicated full-stack + quant dev
- Brand designer + content/motion
- Brain foundation built in parallel
- **Tradeoff:** fastest, highest burn pre-revenue

Recommendation — Standard. Enough leverage to ship the access loop and value screen on schedule, without burning premium money before five customers prove the bet. Step up to Premium *after* the beta validates willingness to pay.

The sprint that matters most now

DO THIS FIRST

Run **Sprint 1 — Paid Beta Access Loop + Core Product Value** (Jun 20 - Jul 7). Prove RangeClarity can be a real product, not a visual idea.

WHY THIS, WHY NOW

- The hard asset (a real indicator) already exists — the gap is **proof + a way to pay**
- One complete journey unlocks the only metric that matters: **paying users**
- It needs **no heavy infrastructure** — Whop sandbox + invite-only access
- It forces the two hard decisions (validation + price) to the front, where they belong

THE ONE OUTCOME

A user can land, understand the offer, register, complete a sandbox payment, receive verified access, and see one clear product-value screen.

THEN, AND ONLY THEN

Polish the indicator, build the website brain, and open the private beta — each behind its own evidence gate.

Detail, daily schedule, and ship/no-ship checklist → [RangeClarity_Next_Sprint_Taskbook.pdf](#)
